

Questions for Your Data Scientists	Task	Admin Course Lesson / Section
How much memory and CPU will you typically need? And what are the max resources required? Do you need access to more GPUs or a specialized machine?	Create additional Node pools if needed, then add hardware tiers. Modify auto-scaling groups if necessary	Hardware Tiers <i>Managing the Compute Grid</i>
What is the typical volume size you'll need to work with data in a project? How many workloads do you expect to run at once?	Change settings that balance cost and execution startup time such as the defaults for number of concurrent runs, project volume size	Compute Grid Central Configs <i>Managing the Compute Grid</i> Persistent Volumes <i>Storage</i>
What Python packages, R libraries, or other specialty tools do you need? Will you be using our On-Demand distributed computing clusters?	Create global environments containing common data science tools for your company, and the setup for On-Demand Ray or Spark if using	Compute Environments <i>Environments</i>

Will the majority of Domino users be practitioners or just consuming results created by a small team? Are there multiple teams that are managed by different people?	If desired, change default user from Practitioner to LightUser. Assign Admin and Project Manager Roles. Sync roles to your identity provider in Keycloak if needed.	User Roles Keycloak (if role sync desired) <i>Managing Users and Authentication</i>
Will groups of people need to share environments without my approval? Will teams need access to expensive hardware tiers that should be hidden from the rest of the group? Will we need to give owner level access of important projects to a group so they don't live under a single user's account?	Set up Organizations, determine if these should be synced to Active Directory groups. Restrict hardware tiers to specific Orgs if necessary.	Organizations Keycloak (<i>if Org sync desired</i>) <i>Managing Users and Authentication</i>

What data sources do you need access to? Should we store all code in Git and build Domino projects off of those repositories? Do we have best practices around data management?	Set up connections to outside data sources such as S3, MySQL, etc. Provide instructions to users on how to access your enterprise Git account and set best practices. Register external volumes if using.	Data Source Connections <i>Managing Data in Domino</i>
Do we want our projects to follow a specific template? How do we want to deploy and monitor models?	Create a template project and add it to the quick-start project that appears for new users. Define best practices for your team on hardware tier usage, model deployment, collaboration, etc.	Best Practices for Setting Up New Users <i>Wrapping Up</i>
Should we allow Public projects? Do we need to add content to the <i>allowlist</i> for Web Apps?	Disable public projects if desired, add resources to the <i>allowlist</i>	Security Overview <i>Monitoring and Security in Domino</i>

What usage metrics do I want to monitor, how often, and how concerned about cost are we?	Set up Control Center APIs or usage reporting if desired.	View Compute Spending and Assets <i>Monitoring and Security in Domino</i>
